FEBRUARY 1984

ROCKY MOUNTAIN ARSENAL
COMMERCE CITY COLORADO 80022

ACKNOWLEDGEMENTS

Personnel of the Environmental Division (ED), Rocky Mountain Arsenal conducted the 360° Monitoring Program during 1983. Support from the Analytical Systems Branch (ASB), Survey Evaluation Office (SEO), and Contamination Migration Branch (CMB) were essential for the production of this report.

Acknowledgements are given to the following personnel of the Environmental Division.

1. All the chemists and technicians of ASB for the analytical work.
2. Ted G. Diebold and Richard D. Engelbrecht of CMB for sample collections.
3. Rose M. Russell and Larry D. Dale of SEO for assistance in compiling data and in graph preparation.
4. William L. Trautmann and Brian L. Anderson of CMB for suggestions in the preparation of this report.
5. Verla R. Inness of ED for manuscript preparation.

Other individuals outside the Environmental Division whose contributions to the preparation of this report are herein recognized.

1. William J. Moloney of Management Systems Control Office for map preparation and publication assistance.
2. Jack C. Pantleo and Jim A. Clark of D. P. Associates for preparation of graphs.

At the time of this report, Dr. Michael E. Witt was the Chief, Environmental Division; Dr. William McNeill was the Director, Technical Operations; and LTC Richard W. Smith, CmlC, was the Commanding Officer of Rocky Mountain Arsenal.

Since the start of the 360° Monitoring Program in 1975, the U.S. Army, Rocky Mountain Arsenal, has been an active participant. The other participants have been Shell Chemical Company and the Colorado Department of Health. Data exchange between the participants has been through periodic meetings of the Technical Review Committee. With the signing of the Memorandum of (RMA), the Colorado Department of Health (CDH), and the Environmental Protection Agency (EPA), the character of the program has changed. The closing of SCC's facilities at RMA reduced Shell's participation in the program.

Since the signing of the MOA, the Army and the CDH are the remaining active participants in the 360° program along with Tri-County District Health Department. Both the Army and CDH support the program with analytical laboratory work. The Army supports the program with field personnel and equipment. The Tri-County District Health Department furnishes field personnel for sample collection. Additionally, the Army has assumed responsibilities for program management, data management, program review, and data evaluation.

The purpose of this report is to review the 1983 360° Monitoring Program and present the 1984 program schedule. Data is presented in the form of tables, maps, and charts.

Since the participants in the 360° program have changed as well as their levels of participation, this report is intended to serve as a means of communication between those interested in the continuation and improvement of the 360° program. This report is to be issued on an annual basis with semi-annual updates. The Army invites constructive comments, criticisms, and new ideas from all interested parties regarding the 360° Water Monitoring Program. Contributions to the program by agencies outside RMA will not only improve the program, but will make it a means of technical information exchange.

The 1983 360° program schedule, Table 1, was composed of a set of 94 wells and 17 surface sites sampled on a quarterly basis. Sample collection was done by Tri-County District Health Department personnel for sample groups 360C and 360E. All other sampling was done by RMA personnel. Although the program schedule called for 404 samples, weather, field, and hydrologic con-

ditions reduced this number. Sample collection for the program is summarized by Table 2. Site distribution is shown on Plate 1.

Of the 101 sites sampled, 45 showed the presence of one or more chemical species that exceeded an established guideline or standard for drinking water. All of the sites exceeding a guideline or standard were wells. Table 3 summarizes these data. Note that the frequencies with which fluoride, F-, and chloride Cl- exceed guidelines and standards are much greater than those for the organic compounds listed. Only six sites are located off post. Appendix A gives the entire sampling history for the 1983 360° program.

To illustrate the levels and general trends of DIMP, DBCP, and Cl- in ground water near RMA, the data from a set of six wells in the 360° program was plotted as a series of simple graphs, Figures 1-14. The plots were done at the Rocky Mountain Arsenal Information Center (RIC) with Tektronix computer equipment.

The graphs illustrate general trends of selected chemical species in ground water over a six year time period. The graphs show concentrations of the chemical species on the vertical axis and the four quarters of a calendar year on the horizontal axis. The plotting routine would not draw a line between two points that were not consecutive. In order to draw a line between 6a, 6b, and 6c are the sets of data from which the graphs were drawn. Estimated values on the tables are marked with an asterisk (*). Four of the wells LIV, LVII, LVIX, and BOLLERS, are located north of the Arsenal and two wells, LV/LV(a) and XXVIII, are located northwest of the Arsenal. Where there was insufficient data to connect two points or where an entire data set was below detection level, no graph is given.

Several points of general interest are shown by the graphs. A frequent occurrence on the graphs is a drop in concentration of a chemical species during the second calendar quarter. This is shown particularly well by the DIMP and DBCP graphs for Well LIV, although Cl- for other wells shows similar trends. Concentrations of DIMP, DBCP, and Cl- tend to stay within narrow ranges. Note particularly in Figure 4 DBCP in Well BOLLERS, 1981-1982.

1983, and Figure 5, chloride in Well LVII, 1978, 1979, 1980. The concentration levels of DIMP, DBCP, and Cl⁻ are generally below established guidelines or standards. Exceptions to this tendency are DIMP and DBCP in Well LIV, Figures 6 and 7, and DBCP in Well BOLLERS, Figure 4.

Over the 1978-83 time period at Well LIV, DIMP levels dropped from a high of 1074 ug/l in the first quarter of 1979 to a low of 57 ug/l during the second quarter of 1983. Although the values fluctuated between these extremes, the overall trend in DIMP concentration at this well has been steadily downward. The last time that DIMP concentration exceeded the 500 ug/l standard was during the first quarter of 1982 when it reached a level of 528 ug/l.

While an extreme value showed up during 1980, the DBCP level at Well BOLLERS has stayed within a small range, 0.3 ug/l to 0.6 ug/l, during the past six years. The tendency for DBCP to remain nearly steadily in concentration is paralleled by similar tendencies for DIMP and Cl⁻, Figures 3 and 5. The nearly steady levels of DIMP, DBCP, and Cl at Well BOLLERS are in contrast to a fluctuating DBCP level at Well LIV, Figure 1.

Well LVII showed increasing levels of DIMP and DBCP during 1978-80, while Cl⁻ remained at a steady level for the same time period, Figures 9-11. In the 1981-83 time period DIMP, DBCP, and Cl⁻ showed distinct declines in concentration levels. This well is located about one quarter mile northwest of Well BOLLERS.

Well LVIX located about one half mile southeast of Well BOLLERS has not shown any DBCP in it. DIMP concentration in this well, Figure 12, has been at a level slightly less than half of the DIMP level at Well BOLLERS. Cl⁻ follows a similar pattern, Figure 13, although the concentration of it appears to be just over half that found at Well BOLLERS.

Wells XXVIII and LV/LV(a) are located northwest of RMA. Although the data from Well LV/LV(a) are limited, Figures 14-15, they show that both DIMP and Cl⁻ have decreased at this well. Well XXVIII has no DIMP or DBCP in it

but shows a steady Cl⁻ level of approximately 90 mg/l, Figure 16. Well LV/LV(a) has limited data because it is an irrigation well that is closed during the fall and winter months.

Figures 1-14 show that water quality trends in wells can be: (1) increasing; (2) decreasing; (3) static; or (4) fluctuating. The graphs show different trends due to variations in hydrologic conditions, aquifer material, well construction and use, and behavior of chemical species in aquifers. Because of the interaction of these factors, every well produces a set of trends in its chemical constituents that reflects the overall hydrologic setting in its immediate vicinity.

The 1984 360° program schedule is shown in Table 4. The major difference in this schedule from that of 1983 is the inclusion of 12 additional off post wells in sample group 360E. Wells 22-13 and 22-29 are not on the 1984 schedule. Well 22-13 was destroyed during construction of the Northwest Boundary treatment system in 1983 and Well 22-29 went dry before it was sampled. Sampling is to be conducted on a quarterly basis as before. The total number of sites in the 1984 program is 111. Samples will be collected at 94 wells and 17 surface sites. The schedule of analytical parameters will be the same as that of the 1983 program. (See Table 5). The distribution of sites for the 1984 program is shown on Plate 2.

Table 6c

APPENDIX A

The data contained in Appendix A is arranged by site identification, well or surface site, in ascending numerical order. Generally, each page shows the complete sampling history of a site for 1983 with sampling dates in Julian form. Off-post wells and the surface sites are listed after the on-post wells. The IDENTIFIER field in the listing is limited to six characters. Because of this limitation, some site ID's are truncated. Reference to the program schedule should resolve any question about an identifier. The example below shows how to read the data.

<u>User Number</u>	<u>Identifier</u>	<u>Lab Number</u>	<u>Collection Date</u>
G10363	<u>3 01014</u>	A30651	<u>83 143</u>
